

Rohit Jire *Java Backend Developer*

 rohitjire55@gmail.com  +4917644429571  Mainz, Germany

 LinkedIn Profile  Web Portfolio  Github Profile

EDUCATION

09.2023 – 06.2026
Bingen, Germany **Masters in Computer Science, Technische Hochschule Bingen**
Master Thesis (Fraunhofer ISST):
• *Benchmarking & Performance Analysis of Data Connectors.*

07.2017 – 05.2021
Pune, India **Bachelors of Engineering in Computer Science, Pune University**

SKILLS

Languages & Frameworks: Java, Spring Boot, Python, TypeScript, Nest.js, React, Go

Backend & Database: REST APIs, Microservices, JUnit, Postgres/Oracle SQL, MongoDB, RabbitMQ

Cloud & DevOps: Git, Maven, Linux/Unix, Docker, Jenkins, CI/CD, AWS S3, Kubernetes, SAP BTP

WORK EXPERIENCE

08.2024 – Present
Walldorf, Germany **SAP, Working Student Java Developer**

- **Led the design and development of a cross-tier synchronization feature**, enabling real-time schema migration across CMS environments with diff-based patching, field-level control, and nested entity handling.
- **Built and extended multiple REST APIs** for bulk data retrieval, advanced query support, admin search, and role-based content export, including full OpenAPI documentation for reusability and evolutivity.
- **Optimized API performance** by refactoring legacy code, improving SQL queries, and introducing batch processing patterns — reducing response times from 50s to under 10s in production, enhancing system stability.
- **Refactored core service layers** from static utilities to Spring-managed components, improving testability, maintainability, and alignment with enterprise-grade dependency injection practices.
- **Strengthened test coverage by 15%** by writing unit and integration tests, migrating test frameworks, and establishing CI-integrated test infrastructure for key controllers.

10.2023 – 07.2024
Mainz, Germany **EnterpriseMindFactory GmbH, Working Student Java Developer**

- **Built backend modules from scratch** using Spring Boot with AWS Keyspace (managed Cassandra) for scalable, cloud-native data storage in a real-time processing context.
- **Implemented authentication and authorization** by integrating Spring Security with Keycloak as the identity provider, collaborating closely with senior developers on security design.
- **Developed data import/export pipelines** for Excel-based workflows, aligning transformation logic with database schema requirements for seamless structured data handling.
- **Designed file processing APIs** for upload/download to AWS S3, leveraging Apache Camel for in-flight transformation and automated re-upload workflows.

08.2021 – 09.2023
Pune, India

T-systems ICT Pvt Ltd, Java Backend Developer

- **Architected RESTful APIs across three microservices** (two Spring Boot, one NestJS/TypeScript), reducing code duplication by 20% and improving platform-wide stability and maintainability.
- **Owned the user-management microservice end-to-end**, redesigning the relational database model in PostgreSQL, eliminating 50% of duplicate records, and improving storage efficiency and query performance.
- **Resolved 30+ production-critical bugs**, ensuring system uptime and stability across high-severity incidents while assisting the team in maintaining and evolving current functionalities.
- **Contributed to agile delivery** by translating user stories into scalable backend solutions and presenting in client-facing sprint demos, consistently achieving 4+ ratings.
- **Recognized with an RnR award** for outstanding contributions to the Data Driven Pricing System project.

Master Thesis

03.2026 – 06.2026
Dortmund, Germany

Benchmarking & Performance Analysis of Data Space Connectors, Fraunhofer ISST

- **Researching the performance characteristics of the Eclipse Dataspace Connector (EDC)** under varying load conditions, measuring latency percentiles, throughput, error rates, and resource consumption (CPU/heap) using k6 as the load testing framework.
- **Deployed and configured a Minimal Viable Dataspace** comprising EDC connectors, Identity Hubs, Vault, Keycloak, MongoDB, and PostgreSQL — both via Docker Compose and Helm on a local Kubernetes (kind) cluster.
- **Designed a GQM-based evaluation methodology** to systematically benchmark Dataspace Protocol operations, including catalog requests, contract negotiations, and data transfers across different deployment configurations.
